1. Applications

TM05 5874-2110

Fig. 1 Grundfos single-stage HS pump

The Grundfos HS pumps are used for liquid transfer and pressure boosting in these main fields of application:

- Commercial systems
- Industrial systems
- Water distribution
- Irrigation.

Commercial systems

- Air-conditioning and chilled-water systems
- Water condensing systems and cooling towers
- Boiler feed and condensate systems
- District heating plants and heating systems
- District cooling plants
- Swimming pools and fountains.

Industrial systems

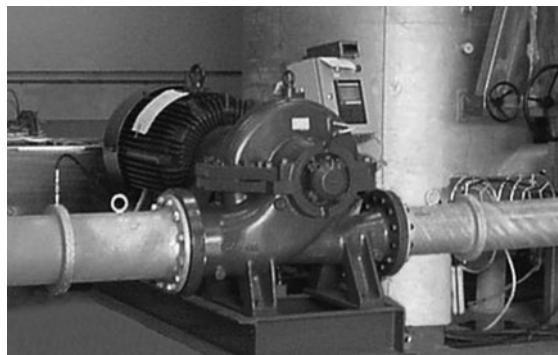

- Process cooling and chilled water systems
- Industrial heating systems
- Wash down and cleaning systems

Water distribution and water treatment

- Public waterworks
- Non-potable water systems.

Irrigation and aquaculture

- Field irrigation (flooding)
- Sprinkler irrigation.

TM03 3903 1106

Fig. 2 HS pump in industrial pressure boosting

GR 2910

Fig. 3 HS pump in sprinkler irrigation

2. Features and benefits

The Grundfos HS horizontal split case pump is a single stage, centrifugal volute pump with high energy efficiency and low life-cycle costs.

Ease of service and long-term reliability are two of the selling features of the HS pumps. The split case design enables removal and dismantling of the internal pump parts (bearings, wear rings, impeller, and shaft seals) without disturbing the motor or pipework. The two-bearing design means less vibration and higher reliability. The separate bearing housings allow for inspection of the seals, sleeves and bearings without removing the top half of the casing.

The double-suction design reduces axial forces by directing flow into both sides of the impeller. The double-volute design, available on most models, reduces the radial load and minimizes noise and vibration. Shaft sleeves are used to protect the shaft from corrosion and wear, thus extending the overall life of the shaft and the pump.

- HS pumps cover this performance range:
Flow rate: 10 to 2700 m³/h.
Head: 5 to 215 m.
- Motor (P2): 1.5 to 600 kW.
- The pumps are non-self-priming, centrifugal volute pumps with radial suction and radial discharge ports and horizontal shaft.
- Suction and discharge flanges are PN 16 according to EN 1092-2 (DIN2501). The pumps are also available with PN 10 flanges for the low pressure range.
- The pump is long-coupled with a totally enclosed fan-cooled standard motor with main dimensions to IEC and DIN standards and mounting designation B3 (IM 1001).
- The rotating assembly is dynamically balanced according to ISO 1940 class G6.3.
- Impellers are hydraulically balanced.
- Pump and motor are mounted on a common base frame in the form of a welded, steel C-channel profile.
- Grundfos HS pumps are available in three different variants:
 1. Pump with motor and base frame (see fig. 4).
 2. Bare shaft pump, i.e. pump without motor, with base frame (see fig. 5).
 3. Bare shaft pump, i.e. pump without motor, without base frame (see fig. 6).

3. Performance range

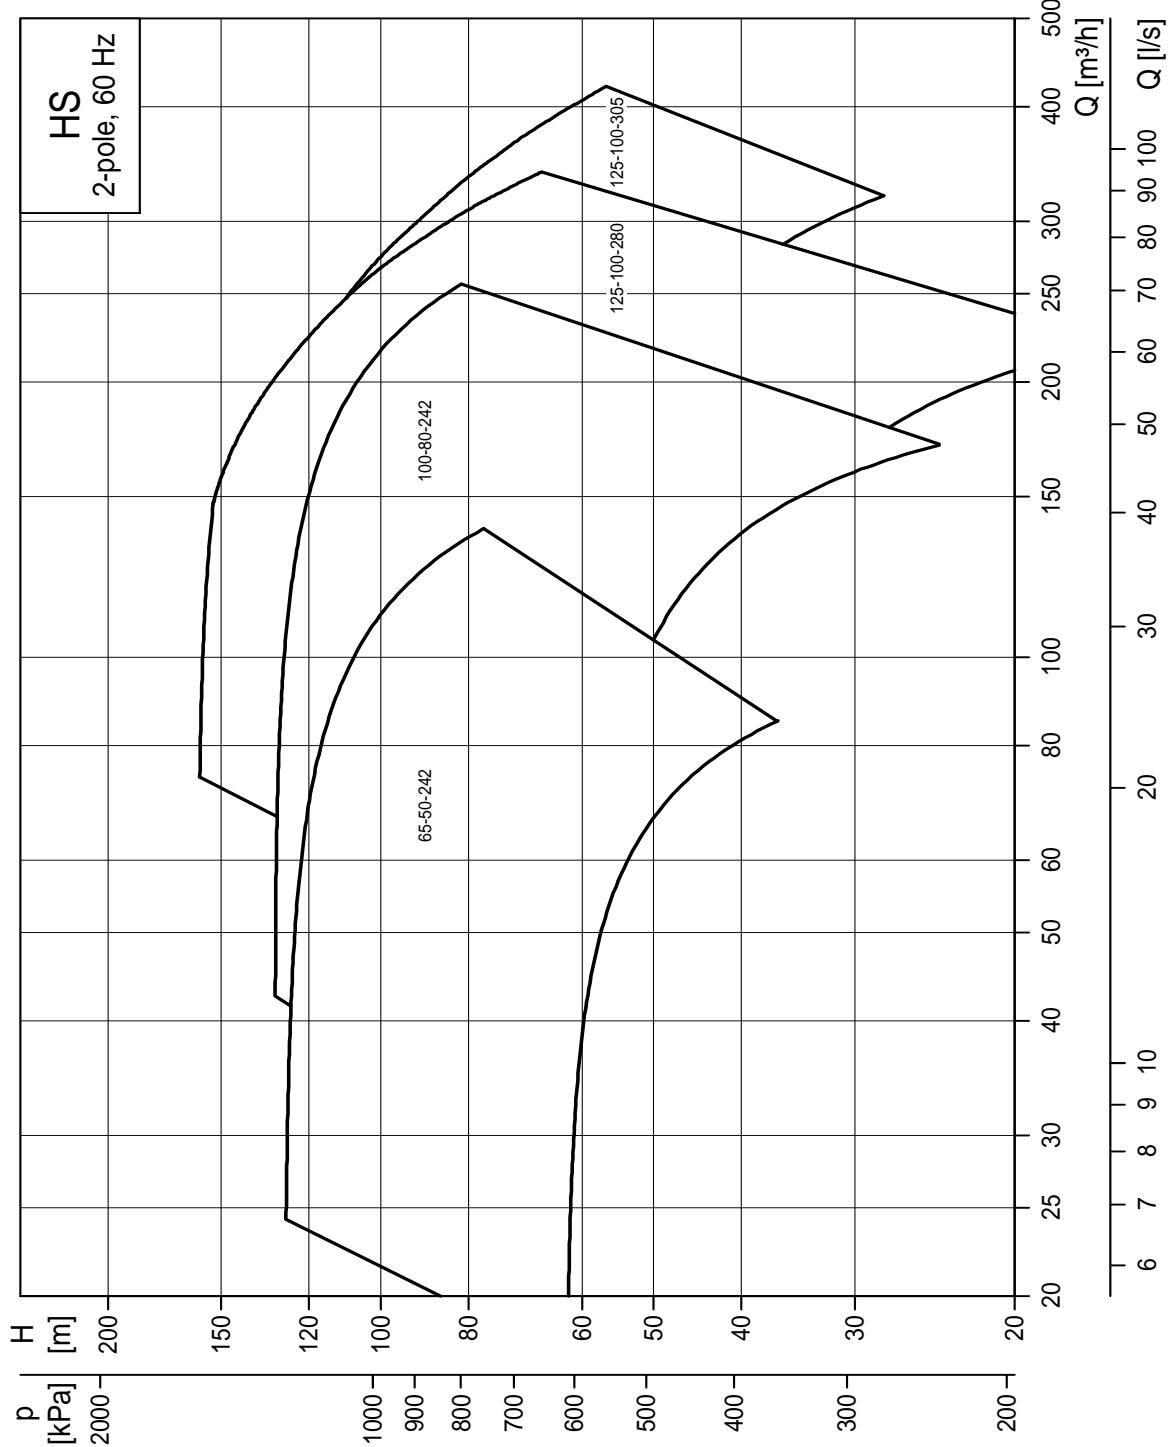

Grundfos HS pumps are available with 2-, 4- or 6-pole motors.

The next three pages show the performance range covered by these three motor types.

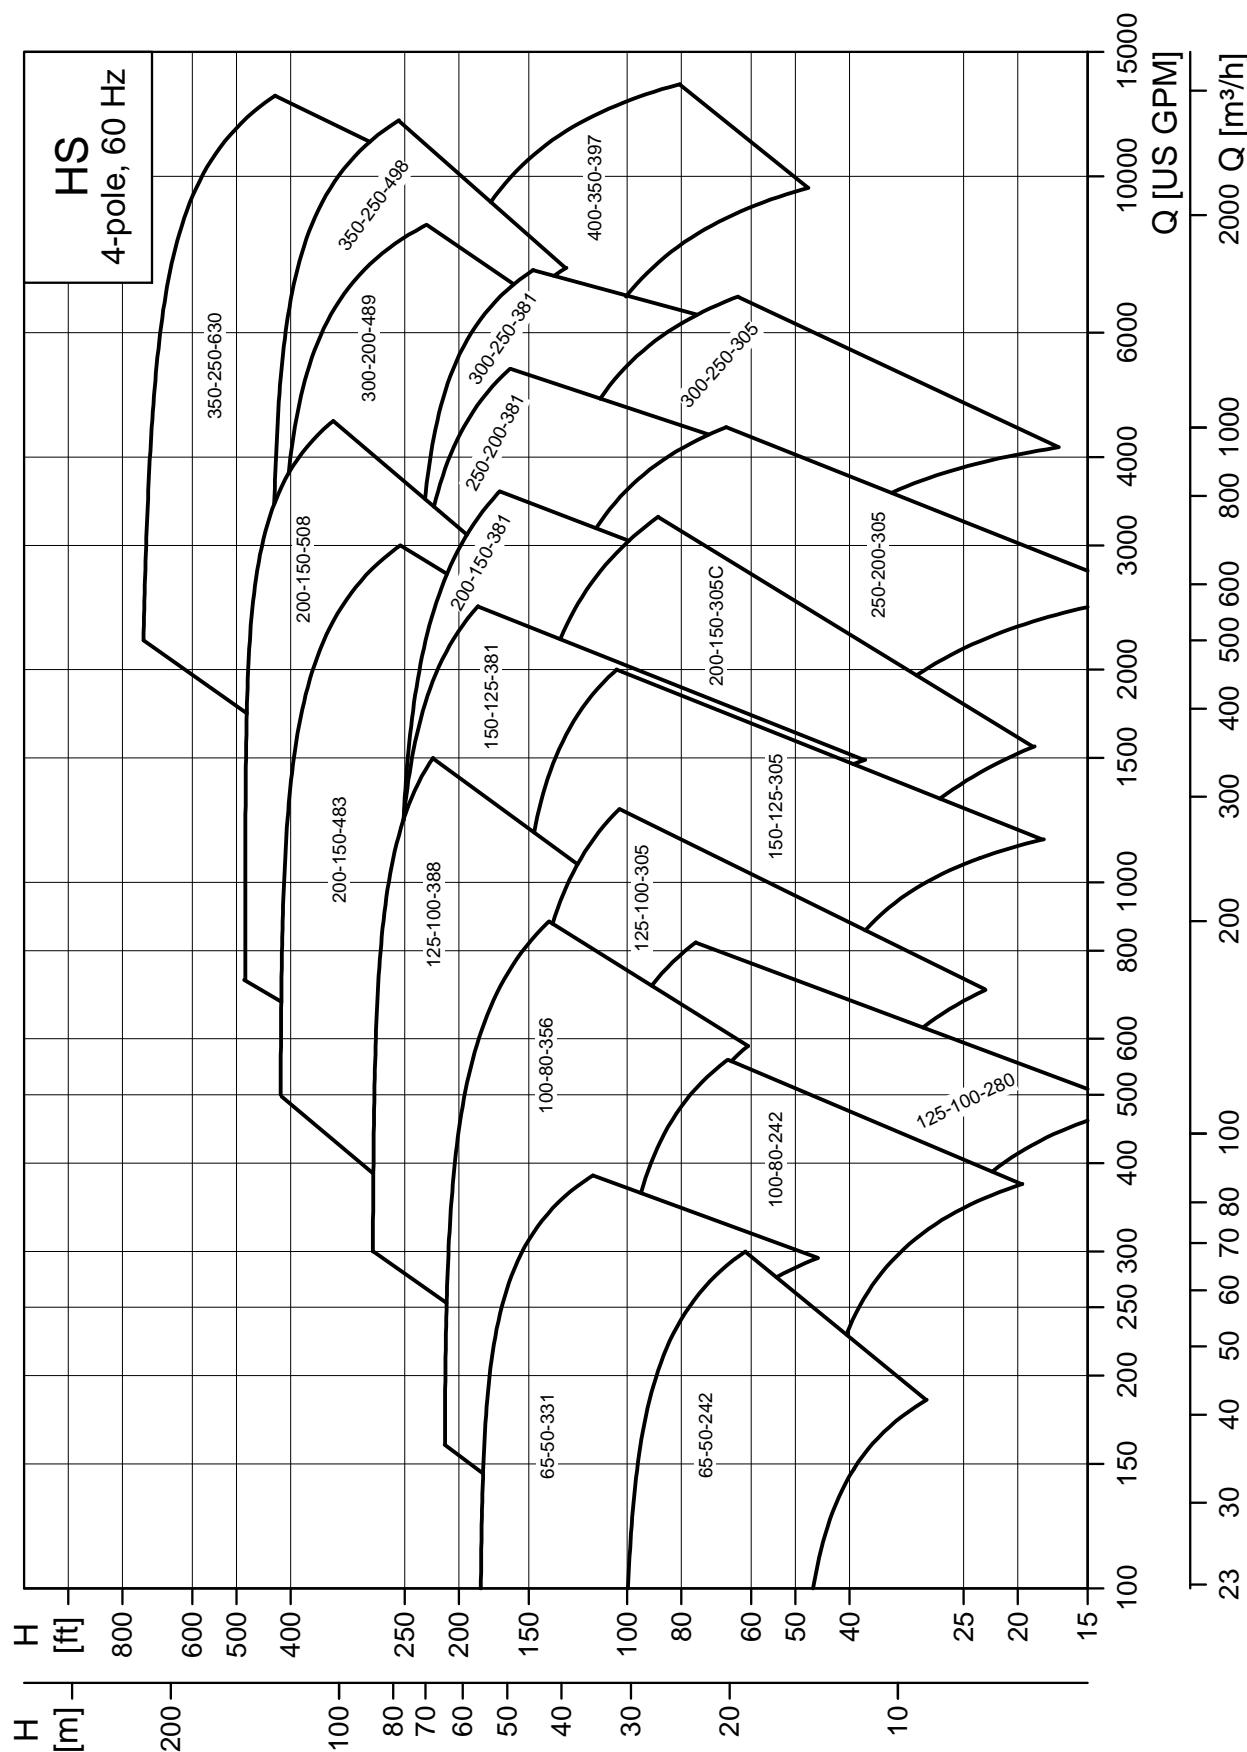

Knowing your required duty point, use the performance ranges like this:

1. Go into the relevant performance range chart.
2. Find your duty point.
3. Note which pump type covers your duty point.
4. Go to the "Pump range" on page 9 and find the selected pump. Go to the listed page number in the "Curve charts and technical data" on page 29 to find more detailed information on your chosen pump.

Pump direction of rotation	CW - clockwise	CCW - counter-clockwise

To a great extent the pumps can be adapted to the requirements of the individual customer. For customised solutions, contact your local Grundfos company.

Note: IE2 standard. IE3 optional

Pump range

The table below gives an overview of the HS pump range (PN16). The PN 10 pump range does not include all impeller sizes (see individual performance curves).

The product range includes the pumps established in WebCAPS.

HS pumps are available with 2-, 4- or 6-pole motors; other motor pole numbers are available on request.

HS pumps are available in several different construction types, all with mechanical shaft seal.

The example shown is an HS 65-50-242/241.3, standard type with standard coupling, EN 1092-2 flange, ductile iron pump casing with bronze impeller, BBVP mechanical shaft seal and clockwise direction of rotation.

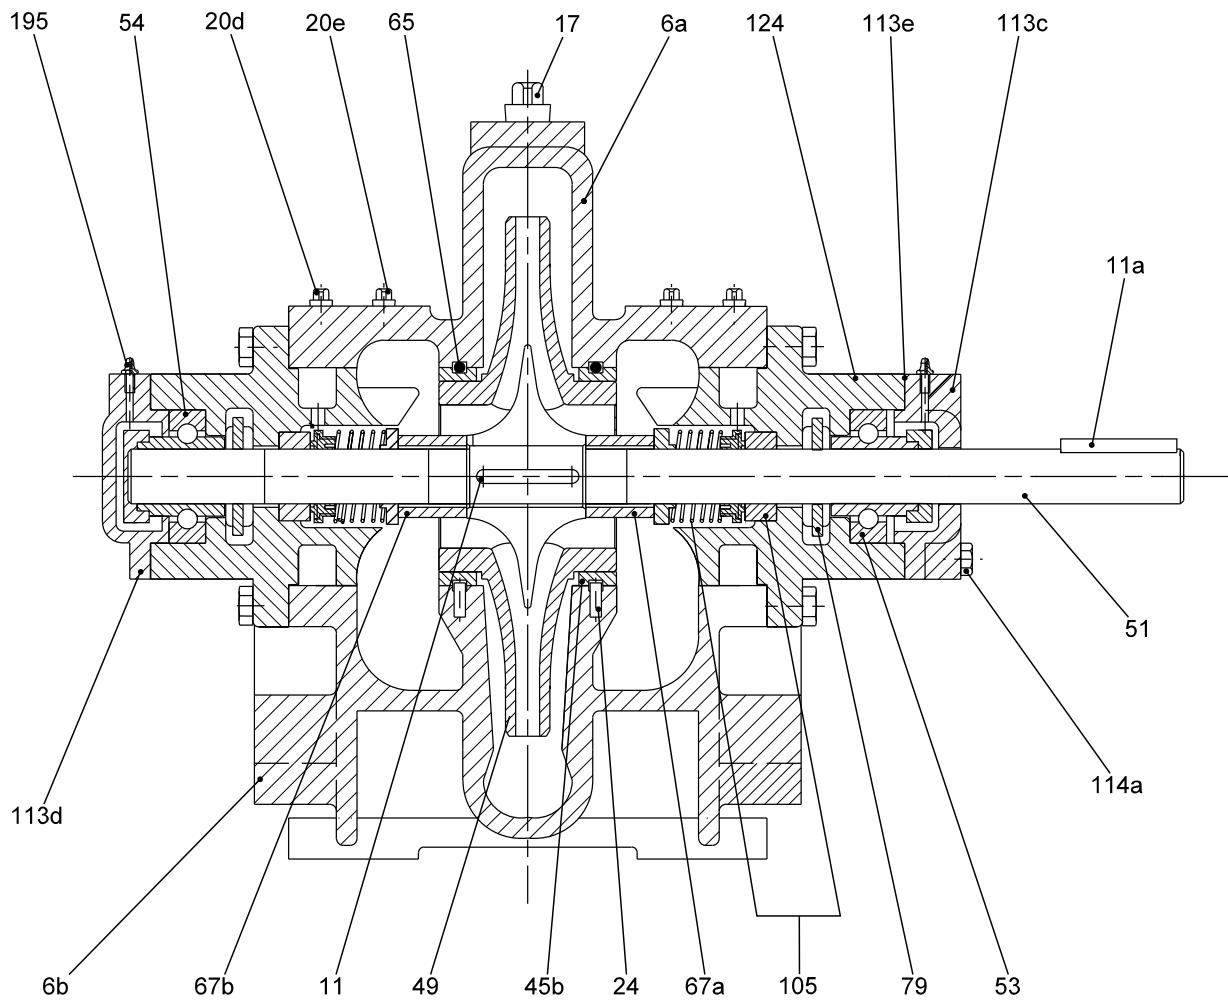

6. Construction

Grundfos HS horizontal split-case pumps are available in four different construction types.

All four construction types are available with stuffing boxes and packing rings as an option. There are small differences within each construction type. For further information, see detailed exploded views of all variants in WebCAPS.

All sizes shown are NPT standard tapered pipe threads

All quantities are one unless otherwise noted

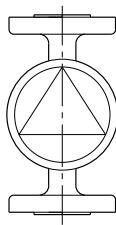

Mechanical construction

Position numbers in the following section refer to the sectional drawings and material specification mentioned in "Construction" on page 11.

Pump casing

The ductile iron volute pump casing has radial suction port and radial discharge port.

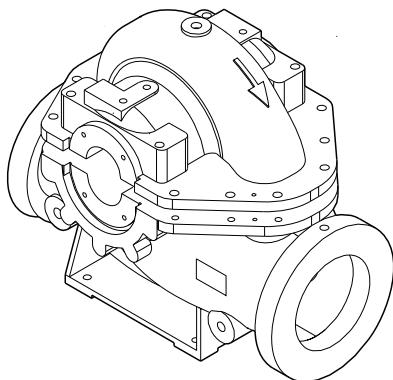

The pumps are of the in line (symmetric) design.

TM04 0476 0708

Fig. 13 Schematic drawing of an in line HS pump

Flange dimensions are in accordance with EN 1092-2 (DIN 2501).

TM04 0475 0708

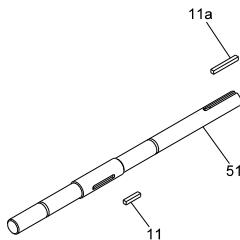

Fig. 14 Upper and lower pump casing of HS pump

Shaft

The shaft (pos. 51) is of the key and keyway type with one key for the impeller (pos. 11) and one key for the coupling (pos. 11a).

The shaft is supported by bearings at both the drive end and the non-drive end of the pump.

The shaft is made of stainless steel (AISI 420).

TM04 0477 0708

Fig. 15 HS pump shaft

Shaft sleeves are attached to the pump shaft to prevent wear of the shaft and secure the position of the impeller.

The shaft sleeve is made of bronze.

Bearings

HS pumps are fitted with two standard single-row deep-groove ball bearings. The bearings are of the open type permitting the bearings to be relubricated. The bearings are lubricated by Grundfos prior to delivery.

Seal housings

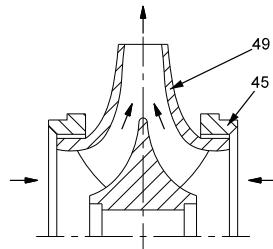

All HS pumps have two seal housings (pos. 124), one at the drive end and one at the non-drive end of the pump shaft.

A seal housing has several functions:

- Supports the pump sealing system, whether it is a mechanical shaft seal or a stuffing box.
- Supports the bearing housing thus transmitting both radial and axial forces from bearing and shaft to the upper and lower pump casing.
- Acts as connection for the flushing pipe.
The function of the flushing pipe (optional) is to ensure a flow of pumped liquid for cooling and lubricating the mechanical shaft seal or the stuffing box.

Impeller

The HS impeller (pos. 49) is a closed double-suction impeller. The impeller has inflow of liquid from both sides and is locked in position by a threaded shaft sleeve.

TM03 3891 1106

Fig. 16 Double-suction impeller

All impellers are dynamically balanced in accordance with ANSI/ISO 1940 Class G6.3 standard. Due to their design, the impellers are inherently hydraulically balanced and thus compensate for axial thrust.

All impellers are trimmed to the duty point required by the customer and dynamically balanced together with the shaft.

Wear rings

HS pumps have wear rings (pos. 45) between impeller and pump casing.

As the name indicates, the wear rings protect the pump casing against wear. The wear rings act as seal between impeller and pump casing.

When the wear rings become worn, the efficiency of the pump will be reduced, and the wear rings should be replaced.

Coupling

As standard, HS pumps are fitted with a flexible grid coupling.

The coupling consists of two steel flanges with tapered teeth and a grid spring to transmit the torque. The coupling is held together by horizontally split coupling halves.

The coupling design assists in reducing vibrations and cushions shock loads. The design also extends the life of the coupling itself.

TM04 0478 0708

Fig. 17 Flexible grid coupling

A fully enclosing coupling guard is mounted between the pump and the motor.

Base frame

Pump and motor are mounted on a common base frame designed according to Hydraulic Institute standard, ANSI/HI 1.3-2000.

Surface treatment

Prior to delivery to the customer, pump, motor and base frame are top-coated with a black semi-gloss RAL9005 coating; coating thickness is 25 µm.

Standard units are not painted internally.

Test pressure

Pressure testing is made with water at +20 °C containing corrosion inhibitor.

The standard hydrostatic test pressure is 1.5 times pressure against "closed valve" or "shut off" pressure. However, this may vary from one HS pump to another. See table below.

Rated pressure	Operating pressure		Test pressure	
	bar	MPa	bar	MPa
PN 10	10	1.0	15	1.5
PN 16	16	1.6	24	2.4

Motor

The motor is a totally enclosed, fan-cooled motor with main dimensions according to IEC and DIN standards.

Motor efficiency is categorised according to EN 60034-2-1:2007:

- IE3: MG motors
- IE2: MMG-G motors

Motors available for the HS pump range

Motor range	IE3	IE2
Standard configuration ¹⁾	MG	MMG-G

¹⁾ For motor sizes and electrical data, see "Electrical data" on page 101

Mechanical shaft seal

The HS pumps are supplied with a BBVP shaft seal as standard.

This shaft seal is available on request:

- BBQV
- BBQE

Codes for mechanical shaft seal

The positions (1) - (4) cover four pieces of information about the mechanical shaft seal:

Example	(1)	(2)	(3)	(4)
Grundfos type designation				
Material, rotating seal face				
Material, stationary seat				
Material, secondary seal and other rubber and composite parts				

The following table explains the positions (1), (2), (3) and (4).

Pos.	Type	Short description of seal
(1)	B	Bellows seal, rubber
Material		
(2)	B	Carbon, resin-impregnated
and	Q	Silicon carbide (of the dense type)
(3)	V	Aluminium oxide
Material		
	P	Buna (NBR)
(4)	V	FKM (Viton™)
	E	EPDM

The mechanical shaft seal variant codes are used when stamping the nameplates for identification.

The materials of the shaft seal types have certain characteristics. These characteristics may be of importance when choosing the shaft seal for the pump.

Seal face material

Carbon/aluminium oxide (xBVx)

Good all-round seal for light applications. The seal has the following features:

- Brittle material requiring careful handling.
- Worn by liquids containing solid particles.

- Limited corrosion resistance, $5 < \text{pH} < 9$, depending on ceramic type.
- Relatively good dry-running properties. However, thermal cracks may occur in case of a sudden influx of water to a hot seal after a period of dry running or similar condition.
- The carbon of the seal offers properties very similar to the carbon/tungsten carbide seal. However, compared to the carbon/tungsten carbide seal, the pressure and temperature ranges are limited.

Carbon/silicon carbide (xBQx)

Seals with one carbon seal face have the following features:

- Brittle material requiring careful handling.
- Worn by liquids containing solid particles.
- Good corrosion resistance.
- Can withstand temporary dry running.

The self-lubricating properties of carbon make the seal suitable for use even with poor lubricating conditions (high temperatures) without generating noise.

However, such conditions will cause wear of the carbon seal face leading to reduced seal life.

Secondary seal material

Buna(xxxP)

Buna (NBR) rubber covers a wide range of liquids at temperatures below +100 °C.

- Good mechanical properties.

FKM (xxxV)

FKM rubber covers a very wide range of liquids and temperatures.

- Poor mechanical properties at low temperatures
- Resistant to water up to +100 °C
- Resistant to mineral oils and vegetable oils

Not resistant to alkaline liquids at high temperatures.

EPDM (xxxE)

EPDM Rubber covers a wider range of liquids up to a max temperature of 135 °C.

- Good mechanical properties

Stuffing boxes

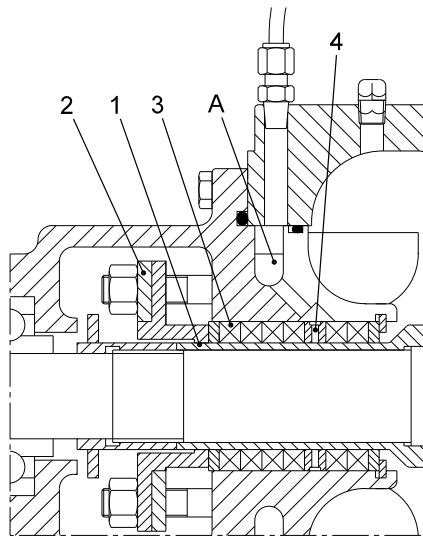

Stuffing boxes of the type SNEK are available as an alternative to mechanical shaft seals.

Codes for stuffing box

Pos.	Code	Short description of stuffing box
1	S	Stuffing box with packing rings
Cooling method		
2	N	Uncooled stuffing box
Barrier fluid		
3	E	With internal barrier fluid
4	K	Synthetic polymer packing rings, graphite impregnated. NBR O-ring in the pump

The stuffing box includes graphite-impregnated packing rings.

The packing rings consist of braided material which is effective for ensuring long service life for packing rings while protecting the shaft (sleeve). When fitted, the packing rings are symmetrical, having parallel facings that prevent tilting.

TM04 1849 1108

Fig. 18 Sectional view of a stuffing box with internal flushing liquid

Pos.	Description
1	Shaft sleeve
2	Gland
3	Packing ring
4	Distribution ring
A	Drilled hole for flushing liquid (pumped liquid)

7. Operating conditions

Ambient temperature and altitude

The ambient temperature and the installation altitude are important factors for the motor life, as they affect the life of the bearings and the insulation system.

Ambient temperature must not exceed +40 °C.

If the ambient temperature exceeds +40 °C or if the motor is installed more than 1000 m above sea level, the motor must not be fully loaded due to the low density and consequently low cooling effect of the air. In such cases, it may be necessary to use a motor with a higher output.

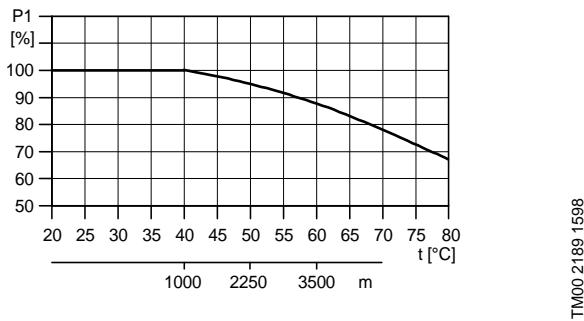

Fig. 19 Relationship between motor output (P2) and ambient temperature

Example:

Fig. 19 shows that the load of the motor must be reduced to 88 % when installed 3500 m above sea level. At an ambient temperature of 70 °C the load of the motor must be reduced to 78 % of the rated output. Liquid temperatures and shaft seals

The maximum liquid temperature marked on the pump nameplate depends on the mechanical shaft seal used:

- Temperature range for NBR (BBVP - standard): 0 °C to +100 °C.
- Temperature range for FKM (BBQV - optional): +15 °C to +100 °C.
- Temperature range for EPDM (BBQE - optional): +15 °C to +135 °C.

Minimum temperature of -12°C can be achieved for certain applications. Contact the factory for specific information.

Pressure

Maximum pressure

- Pump made of ductile iron: 16 bar
- Pump made of cast iron: 10 bar.
- 25 bar options available on select models.

Maximum inlet pressure

Inlet pressure + pump pressure must always be lower than maximum pressure of the pump.

Minimum inlet pressure

The minimum inlet pressure must correspond to the NPSH curve for the pump + a safety margin of minimum

0.5 metres head. NPSH appears from the performance curves in "Performance curves-technical data" on page 31.

Flow rate

Minimum flow rate

The pump must not run against a closed discharge valve, as this will cause an increase in temperature/formation of steam in the pump. This may cause shaft damage, impeller erosion, short life of bearings, stuffing boxes with packing rings or mechanical seals due to stress or vibration.

The minimum, continuous flow rate must be at least 25 % of the flow rate at best-efficiency point (BEP).

Maximum flow rate

The maximum flow rate must not exceed the value stated on the nameplate. If the maximum flow rate is exceeded, cavitation and overload may occur.

Maximum particle size

The table shows the permissible size of particles.

Pump type	Maximum particle size (non-abrasive particles) [mm]
HS 65-50-242	4.8
HS 65-50-331	4.1
HS 100-80-242	7.9
HS 100-80-356	7.9
HS 125-100-280	9.7

8. Installation

Reference

Please read this section on installation of HS pumps as an overview of the installation requirements to be fulfilled.

For full details on foundation, mechanical installation, alignment, piping, electrical installation, etc. please refer to the installation and operating instructions for the HS pumps. Installation and operating instructions can be downloaded from Grundfos' homepage, www.grundfos.com, or you may contact your local Grundfos company.

Mechanical installation

Vibration dampers

A specific application may call for vibration dampers to prevent pump vibrations from being transmitted to the building or the pipework. In order to select the right vibration damper, you need this information:

- Forces transferred through the damper.
- Motor speed. In the case of speed control, this must also be taken into account.
- Desired dampening in % (recommended value: 70 %).

The selection of vibration damper differs from installation to installation. In certain cases a wrong damper may increase the vibration level. Vibration dampers should therefore be sized by the supplier of the vibration dampers.

Expansion joints

Expansion joints provide these advantages:

- Absorption of thermal expansion and contraction of pipework caused by variations in liquid temperature.
- Reduction of mechanical influences in connection with pressure surges in the pipework.
- Isolation of structure-borne noise in the pipework (only rubber bellows expansion joints).

Note: Do not use expansion joints to adjust for inaccuracy in the pipework, for instance centre displacement or misalignment of flanges.

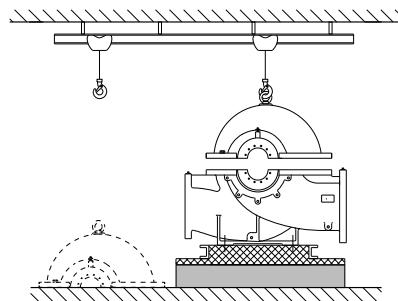

The expansion joints should be fitted at a minimum distance of 2 pipe diameters (DN) away from the pump flange on the suction side. This prevents turbulence in the joints, thus ensuring optimum suction conditions and minimum pressure drop on the discharge side.

At flow velocities $> 2.4 \text{ m/s}$, it is recommended to fit larger expansion joints matching the pipework.

Location

Install the pump as close as possible to the supply of pumped liquid and with the shortest and most direct suction pipe practical.

Install the pump with sufficient accessibility for inspection and maintenance. Allow ample space and headroom for the use of an overhead crane or hoist sufficiently strong to lift the unit.

TM04 0382 0608

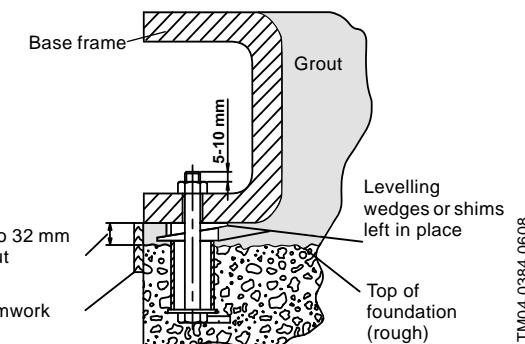

Fig. 20 HS pump with accessibility for inspection and headroom for the use of an overhead crane

Foundation

It is recommended that you install the pump on a concrete foundation which is heavy enough to provide permanent and rigid support for the entire pump. The foundation must be capable of absorbing any vibration, normal strain or shock. As a recommendation, the weight of the concrete foundation should be 3 times the weight of the complete pump unit. For specific requirements, please consult the contractor or the engineer, or comply with established industry standards.

In installations where silent operation is particularly important, a foundation with a mass up to 5 times that of the complete pump unit is recommended.

Grouting

TM04 0384 0608

Fig. 21 Sectional view of foundation with foundation bolt, grouting and base frame

Grouting compensates for uneven foundation, distributes weight of unit, dampens vibrations and prevents shifting. Use an approved, non-shrinking grout. If you have questions or doubts about the grouting, please contact an expert on grouting.

Measuring instruments

To ensure continuous monitoring of operation, we recommend you to install pressure gauges on pump suction and discharge flanges. The pressure gauge on the suction side must be capable of measuring vacuum. The pressure gauge tappings should only be opened for test purposes. The measuring range of the discharge side pressure gauge should be 20 % above the maximum pump discharge pressure.

When measuring with pressure gauges on the pump flanges, please note that a pressure gauge does not register dynamic pressure (velocity pressure). On HS pumps, the diameters of the suction and discharge flanges are different which results in different flow velocities in the two flanges. Consequently, the pressure gauge on the discharge flange will not show the pressure stated in the technical documentation, but a value which may be lower.

Piping

Suction and discharge pipe

In order to minimise friction losses and hydraulic noise in the piping, choose piping that is one or two sizes larger than the pump suction and discharge ports. Typically, flow velocities should not exceed 2 m/s (6 ft/sec) for the suction pipe (port) and 3 m/s (9 ft/sec) for the discharge pipe (port).

Make sure that the NPSH available (NPSHA) is higher than the NPSH required (NPSHR). NPSH = Net Positive Suction Head.

General precautions

When installing the piping, observe these precautions:

- Always run the piping direct to the pump.
Note: Make sure that both suction and discharge piping are independently supported near the pump so that no strain is transmitted to the pump when the flange bolts are tightened. Use pipe hangers or other supports with necessary spacing to provide support.
- When expansion joints are used in the piping system, fit the joints at a minimum distance of 2 pipe diameters away from the pump on the suction side. This prevents turbulence in the joints, thus ensuring optimum suction conditions.
- Install piping as straight as possible and avoid unnecessary bends. Where necessary, use 45° or long sweep 90° fittings to reduce friction loss.
- Where flanged joints are used, ensure that inside diameters match properly.
- Provide for expansion of pipe material by means of expansion joints on both sides of the pump.
- Always allow sufficient space/accessibility for maintenance and inspection.

Suction piping

Note: The sizing and installation of the suction piping is extremely important.

Locate the pump below system level whenever possible. This will facilitate priming, assure a steady liquid flow and provide a positive suction head.

Many NPSH problems can be avoided if the suction piping is properly installed.

System types

These pumps can be installed in two types of system:

1. Closed systems or open systems where the liquid level is above the pump inlet (flooded systems), meaning that a positive¹⁾ inlet pressure will be available.
2. Open systems where the liquid level is below the pump inlet (suction lift), meaning that a negative¹⁾ inlet pressure will be available.

1) Positive or negative inlet pressure in relation to ambient atmospheric pressure.

General suction piping guidelines

Avoid air pockets or turbulence in the suction pipe. Never use reducers in a horizontal suction pipe as shown in Fig. 23. Instead, use an eccentric reducer as illustrated in Fig. 22.

TM04 0093 4907

Fig. 22 Correctly mounted reducer

TM04 0092 4907

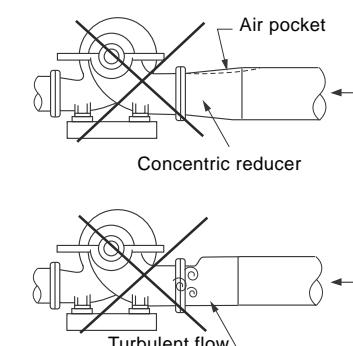

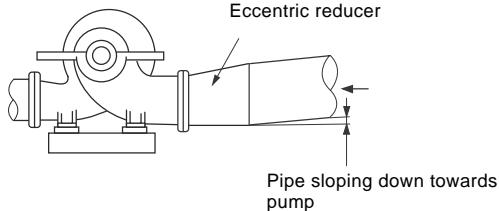

Fig. 23 Reducers resulting in air pockets and turbulence

Flooded systems

(Closed systems and open systems where the liquid level is above the pump inlet).

Correct

TM04 0148 4907

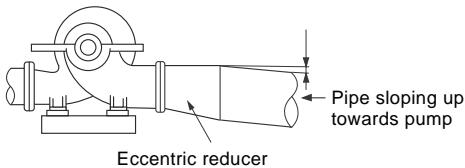

Fig. 24 Correctly mounted suction piping

Suction lift systems

(Closed systems and open systems where the liquid level is below the pump inlet).

Install the suction pipe sloping upwards towards the suction port. Any high point in the pipe will be filled with air and thus prevent proper operation of the pump. When reducing the piping to the suction port diameter, use an eccentric reducer with the eccentric side down to avoid air pockets

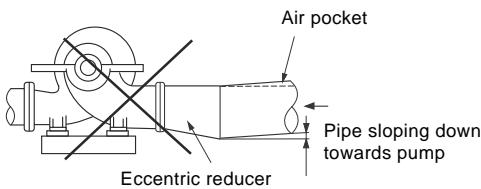

Correct

Fig. 28 Suction piping resulting in air pockets

Installations with vertical suction piping in confined space

TM04 0096 4907

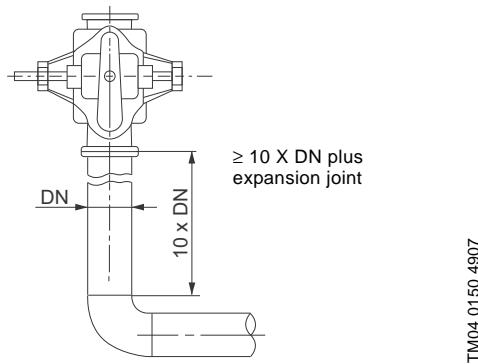

Fig. 29 Suction diffuser (1) in the suction piping

Suction piping with a horizontal elbow in the feed line

Make sure that the liquid flow is evenly distributed to both sides of the double-suction impellers.

There is always an uneven, turbulent flow through an elbow. See Fig. 31. If an elbow is installed in the suction pipe near the pump in a position other than vertical, more liquid will enter one side of the impeller than the other. This will result in heavy, unbalanced thrust loads overheating the bearings, causing rapid wear and reducing the hydraulic performance.

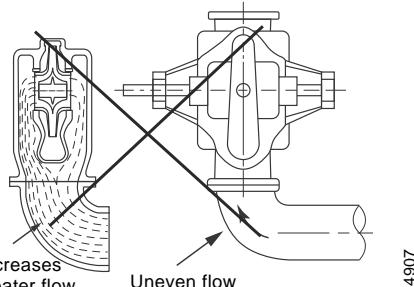

Correct

TM04 0150 4907

Fig. 30 Recommended suction pipe installation with a length of straight pipe between horizontal elbow and pump

Wrong

TM04 0149 4907

Fig. 31 Unbalanced loading of a double-suction impeller due to uneven flow through a horizontal elbow close to the pump

Valves in suction piping

If the pump is operating under static suction lift conditions, install a non-return valve in the suction pipe to avoid having to prime the pump each time it is started. The non-return valve should be of the flap type or a foot-valve with a minimum of pressure loss.

Discharge piping

The discharge pipe is usually preceded by a non-return valve and a discharge isolating/throttle valve. The non-return valve protects the pump against excessive back-pressure and reverse rotation of the pump and prevents back flow through the pump in case of operational stop or failure of the motor.

In order to minimise friction losses and hydraulic noise in the pipework, flow velocities should not exceed 3 m/s (9 ft/sec) in the discharge pipe (port).

On long horizontal runs, it is desirable to keep the piping as level as possible.

Avoid high spots, such as loops as they will collect air and throttle the system or lead to uneven pumping.

Auxiliary piping

1. Drains

Install drain pipes from pump casing and stuffing boxes to a convenient disposal point.

2. Pumps fitted with stuffing boxes

When suction pressure is below ambient pressure, supply the stuffing boxes with liquid to provide lubrication and prevent the ingress of air. This is normally achieved via a flushing pipe from the pump discharge side to the stuffing box. A control valve or orifice plate may be fitted in the flushing pipe to control the pressure to the packing gland/stuffing box.

If the pumped liquid is dirty and cannot be used for flushing the seals, we recommend a separate clean, compatible liquid supply to the stuffing box at 1 bar (15 psi) above the suction pressure.

3. Pumps fitted with mechanical seals

Seals requiring re-circulation will normally be provided with a flushing pipe from the pump casing.

Note: When pumping hot liquids, we recommend that the supply of any external flushing or cooling liquid is continued after stopping the pump. This should be done to avoid seal damage.

9. Selection of product

Pump size

Selection of pump size should be based on these data:

- required flow and pressure
- pressure loss as a result of height differences (geometric lifting height)
- friction loss in the pipework (pipes, bends, valves, etc.)
- best efficiency at the estimated duty point.

Efficiency

If you expect the pump to always operate in the same duty point, select a pump which is operating in a duty point corresponding to the best efficiency of the pump.

In case of varying consumption, select a pump whose best efficiency falls within the duty range covering the greater part of the duty time.

Material

The material variant should be selected on the basis of the liquid to be pumped.

Motor size

The selection of motor size should be based on these parameters:

- flow rate margin, the maximum required flow rate in your application
- motor safety margin.

A selection has to be made for both parameters.

Parameter 1 - flow rate margin in your application

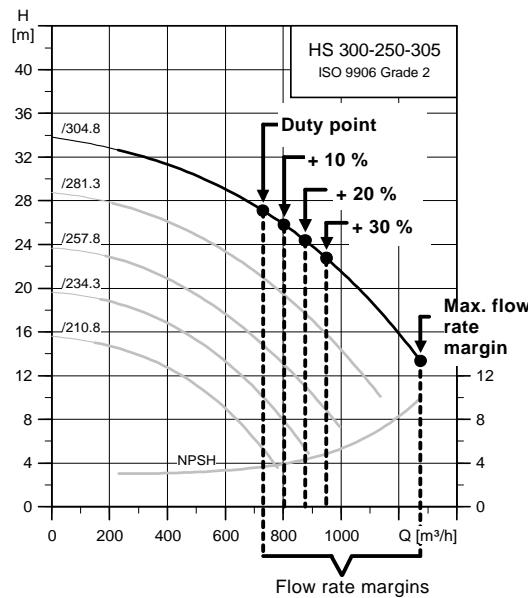

Understanding the operating conditions under which your pump will run is important to ensure long life and trouble-free operation of both the pump and motor. The more specific these parameters are understood, the more refined and specific your motor selection can be.

If you intend to run the pump in one specific duty point, the power absorbed in this point (P2) could in theory be your motor's rated power. However, because of the uncertainties in system calculations or the addition of duty conditions around the primary duty point, it is recommended to have a safety margin for P2 power.

To accomplish this, we recommend the following method for motor selection.

1. Select one of the following flow rate margins for your pump:
 - Duty point to the end of the actual curve (default in CAPS).
 - Duty point + 30 %
 - Duty point + 20 %
 - Duty point + 10 %.

Flow rate margin

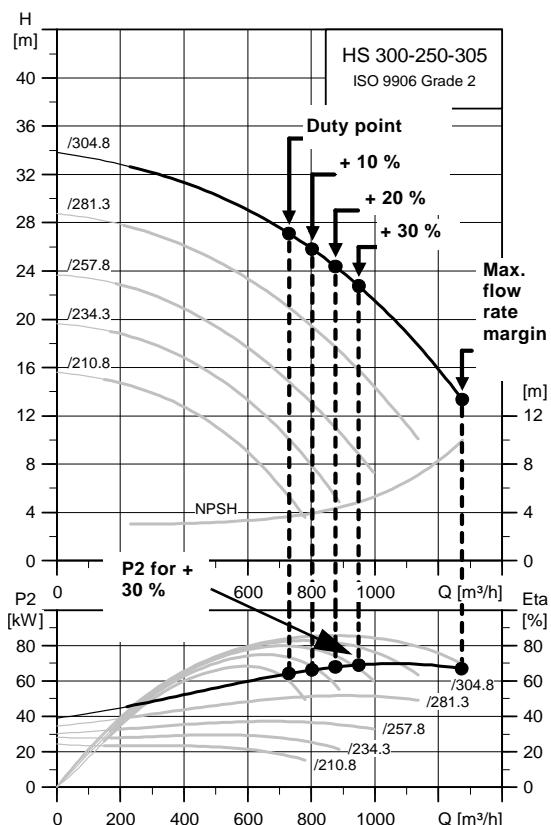

TM04 0454 0608

Fig. 32 Selection of a flow rate margin on basis of conditions around the primary duty point and uncertainties in system calculations

2. Establish P2 for the selected flow rate margin.

Establishing P2

TM04 0349 0608

Fig. 33 Establishing P2 for a selected flow rate margin of 30 %

In some cases, however, the input power actually decreases as the flow rate increases. It will thus be found at some other point within this flow range. This is typically the case when the impeller is trimmed to the smallest diameter.

Decrease of P2 with increase of flow

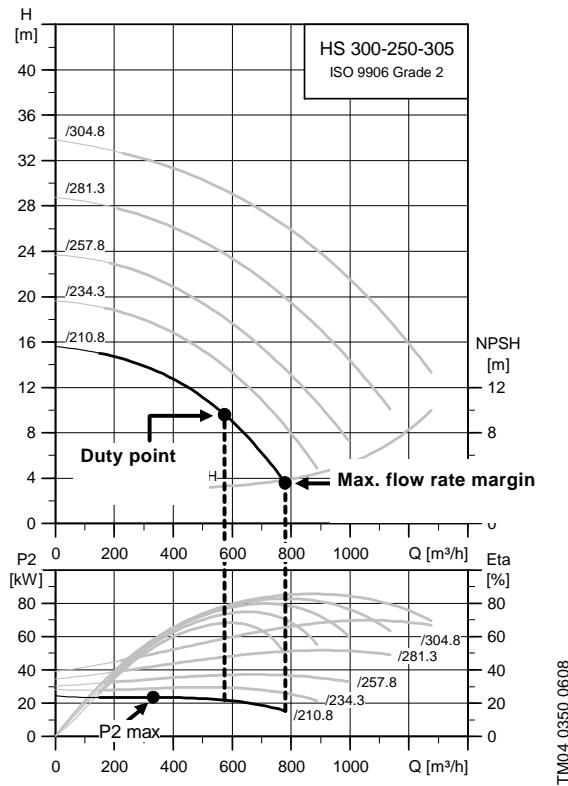

Fig. 34 Establishing the maximum P2 when P2 decreases as the flow rate increases

Parameter 2 - motor safety margin

As with any system, uncertainties and tolerances exist, the motor safety margin takes the following into account:

- The actual head is at the high end of the tolerance described in ISO 9906. This will increase the required P2.
- Pump efficiency is at the low end of the tolerance described in ISO 9906. This will increase the required P2.
- Motor efficiency is at the low end.

To establish the motor safety margin, select method 1 or alternatively method 2:

Method 1

Add a safety margin as outlined in ISO 5199 to the maximum P2 found when determining parameter 1.

(Grundfos recommends the addition of a safety margin in accordance with this standard; default in WebCAPS.)

Required pump power up to [kW]	Motor power P2 [kW]
568	630
505	560
450	500
360	400
320	355
284	315
225	250
180	200
144	160
119	132
99	110
81	90
68	75
49	55
40	45
32.5	37
26	30
19	22
15.9	18.5
12.8	15
9.1	11
6.1	7.5
4.3	5.5
3.2	4
2.3	3
1.7	2.2
1.1	1.5

Fig. 35 Safety margins according to ISO 5199

Method 2

Add a 5 % safety margin to the maximum P2 found when determining parameter 1.

If not specified by the customer, the motor size will be determined in accordance with the WebCAPS defaults, a motor which covers the full performance range and with a motor safety margin according to ISO 5199.

10. Pumped liquids

Pumped liquids

We recommend HS pumps for thin, clean and non-aggressive, non-explosive liquids, not containing solid particles or fibres. The liquid must not attack the pump materials chemically or mechanically.

The mechanical shaft seal must be suitable for the liquid.

Water in heating and ventilating systems often contains additives to prevent negative effects such as system corrosion or calcareous deposits. If you want to use the pump for such liquids and if the temperature is above 80 °C, use special shaft seals to avoid crystallization/precipitation between the seal faces.

Liquid density and viscosity

If you pump liquids with a density and/or viscosity higher than that of water, use motors with correspondingly higher outputs.

The effect of high density on centrifugal pump performance

A high-density liquid only affects the power consumption of a centrifugal pump:

- The head, flow rate and pump efficiency will remain unchanged.
- The power consumption will increase at a ratio corresponding to the increase in density. A liquid with a specific gravity of 1.2 will thus require a 20 % larger power input.
- An oversize motor will often be required.

WebCAPS can help you select the right pump for liquids with a density different from that of water.

The effect of high viscosity on centrifugal pump performance

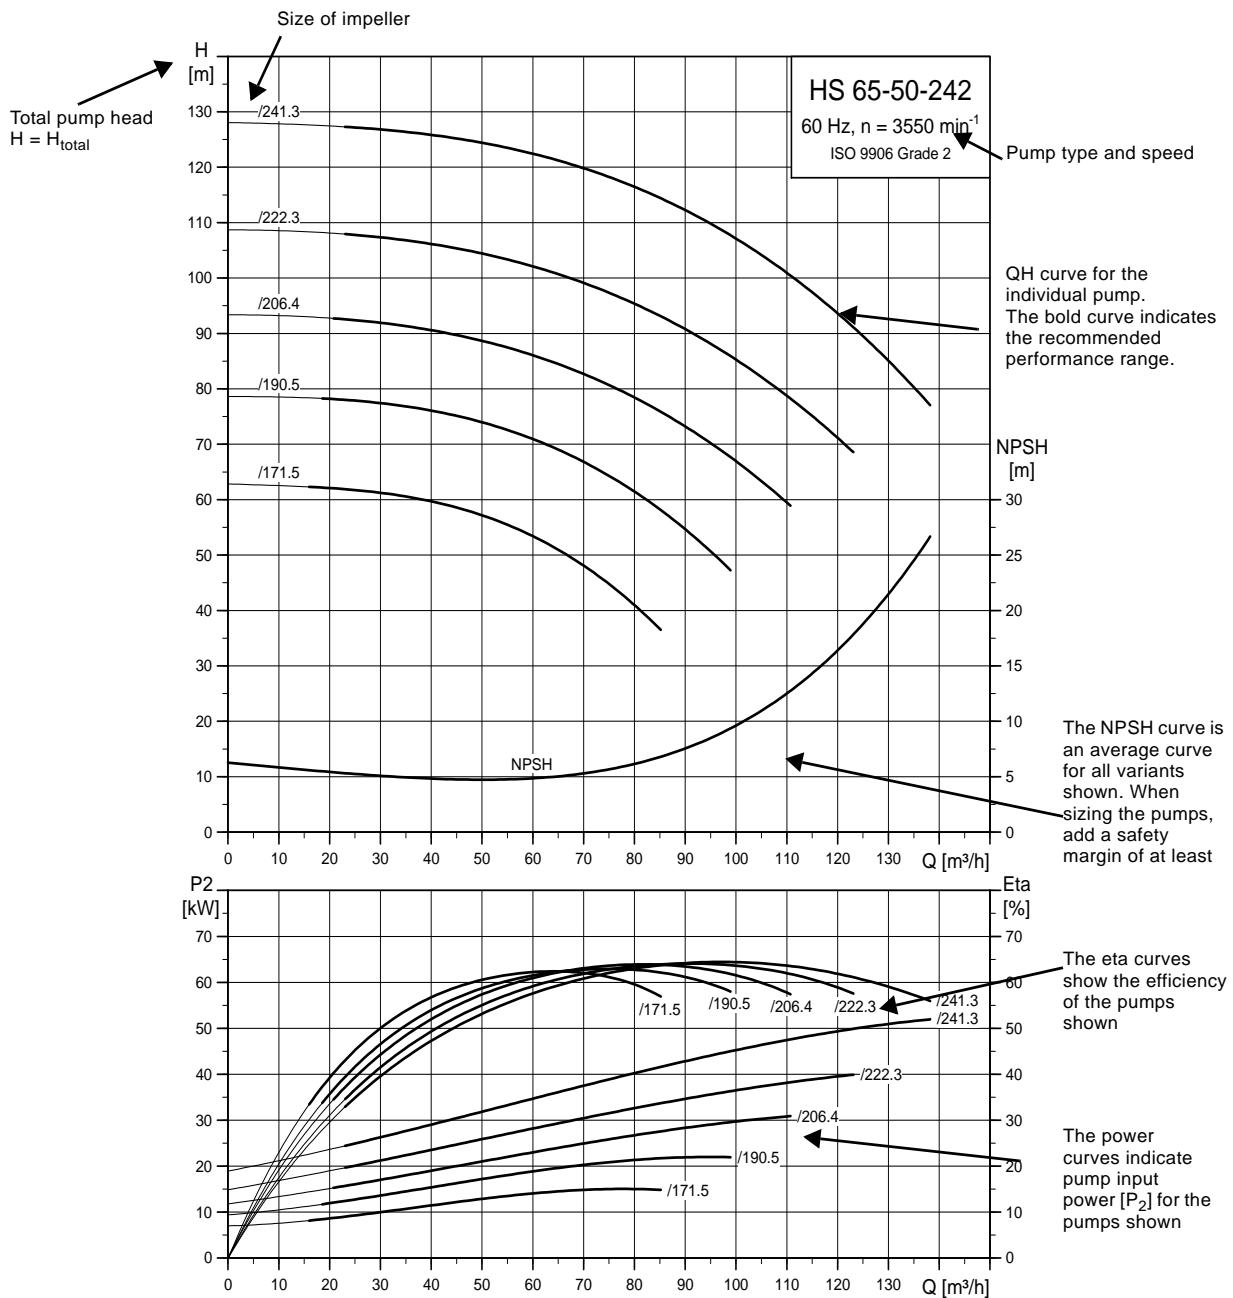

A high-viscosity liquid affects a centrifugal pump in several ways:

- The power consumption will be increased, i.e. a larger motor is required.
- Head, flow rate and pump efficiency will be reduced.

WebCAPS can help you select the right pump for liquids with a viscosity different from that of water.

11. Curve charts and technical data

How to read the curve charts

TM03 2844 5005

Curve conditions

- Tolerances according to ISO 9906, Grade 2.
- The curves show pump performance with different impeller diameters at the nominal speed.
- The **bold** part of the curves show the **recommended** operating range.
- Do not operate the pump along the thin parts of the curves. If your duty point lies here, you should select a smaller or larger pump type.
- Do not use the pumps at minimum flow rates below $0.1 \times Q_{\max}$ stated on the pump name plate because of the risk of overheating of the pump.
- The curves apply to the pumping of airless water at a temperature of +20 °C and a kinematic viscosity of 1 mm²/s (1 cSt).
- ETA: The lines show values of the hydraulic efficiency of the pump for the different impeller diameters.
- NPSH: The curves show average values measured under the same conditions as the performance curves.
When sizing the pump, add a safety margin of at least 0.5 m.
- In case of other densities than 1000 kg/m³ the discharge pressure is proportional to the density.
- When pumping liquids with a density higher than 1000 kg/m³, motors with correspondingly higher outputs must be used.

Calculation of total head

The total pump head consists of the height difference between the measuring points + the differential head + the dynamic head.

$$H_{\text{total}} = H_{\text{geo}} + H_{\text{stat}} + H_{\text{dyn}}$$

H_{geo}	Height difference between measuring points.
H_{stat}	Differential head between suction and the discharge side of the pump.
H_{dyn}	Calculated values based on the velocity of the pumped liquid on the suction and the discharge side of the pump.

Performance tests

The requested duty point for every split case pump produced in Europe is tested according to ISO 9906, Grade 2, and without certification.

In case of pumps ordered on the basis of impeller diameter only (no requested duty point), the pump will be tested at the best efficiency point.

The primary duty point is guaranteed by a certified performance test. Additional point(s), on request, are offered for reference only. Testing certificate has to be ordered separately.

Certificates

Certificates have to be confirmed for every order and are available on request as follows:

- Certificate of compliance with the order (EN 10204-2.1)
- Pump test sheet.

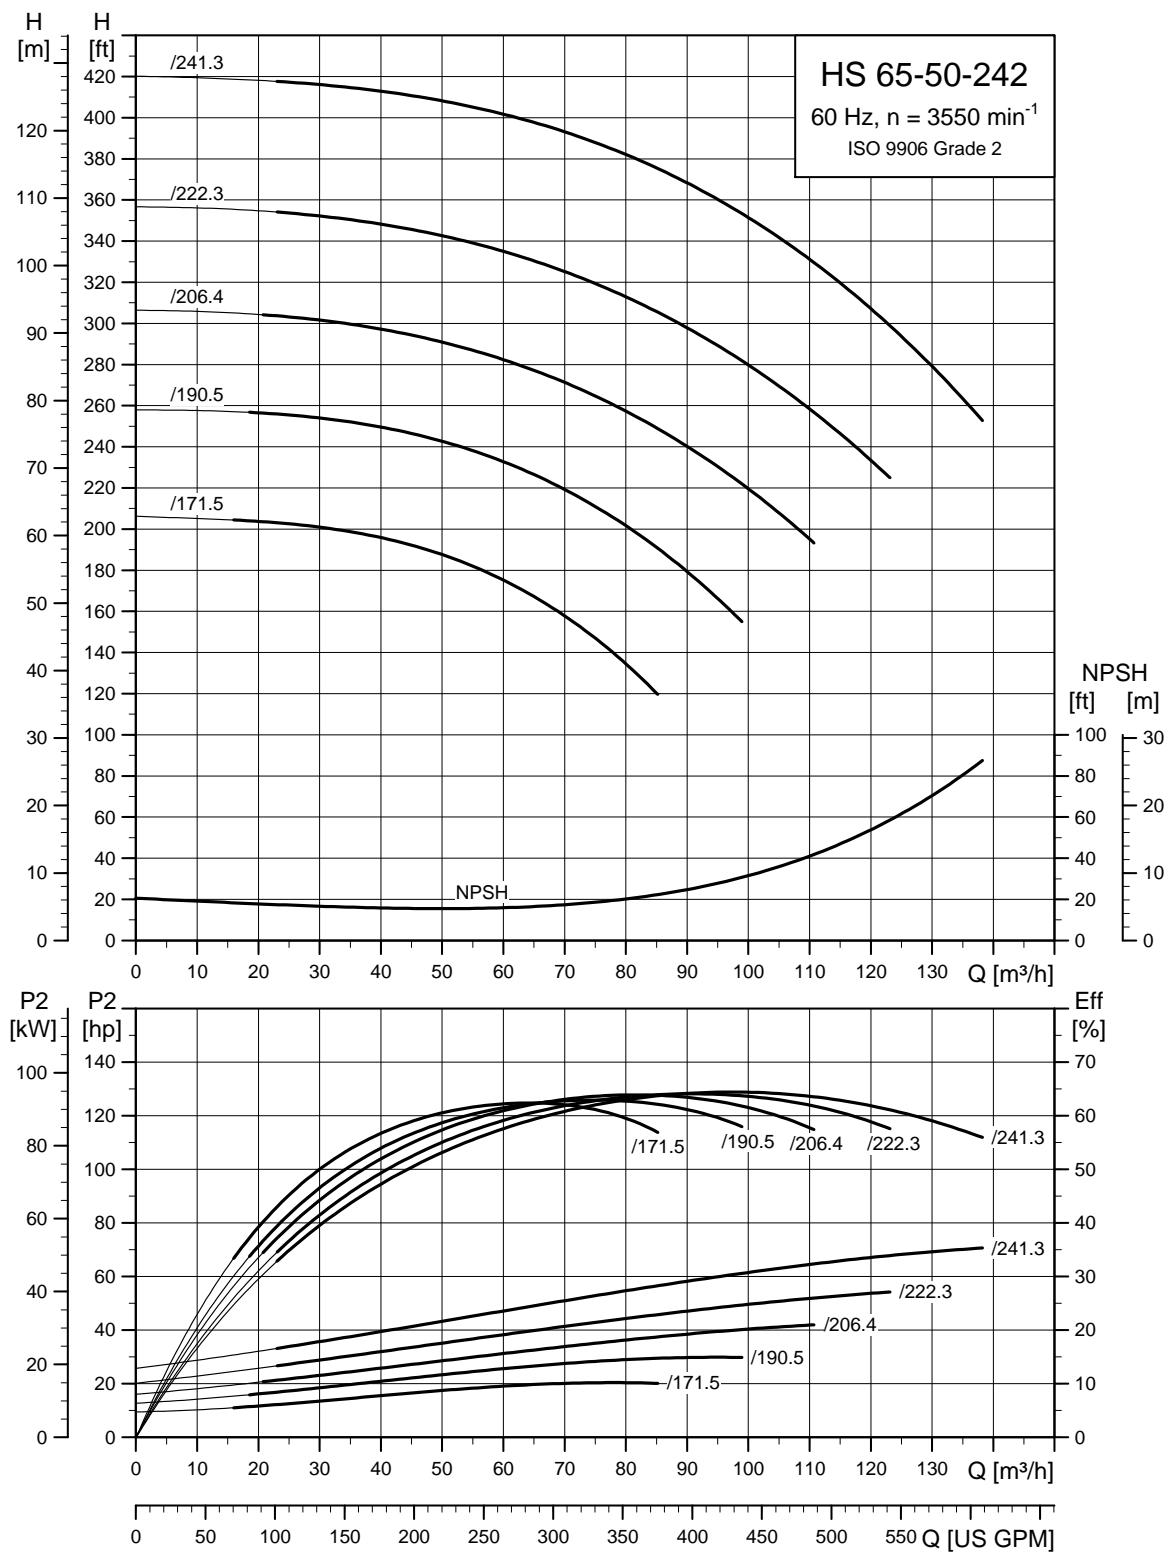

Witness test

When the pumps are being tested or are tested with a certification it is possible for the customer to witness the testing procedure according to ISO 9906.

If the customer wants to witness test the pump performance, place this request on the order.

2-pole HS standard, 125-100-280

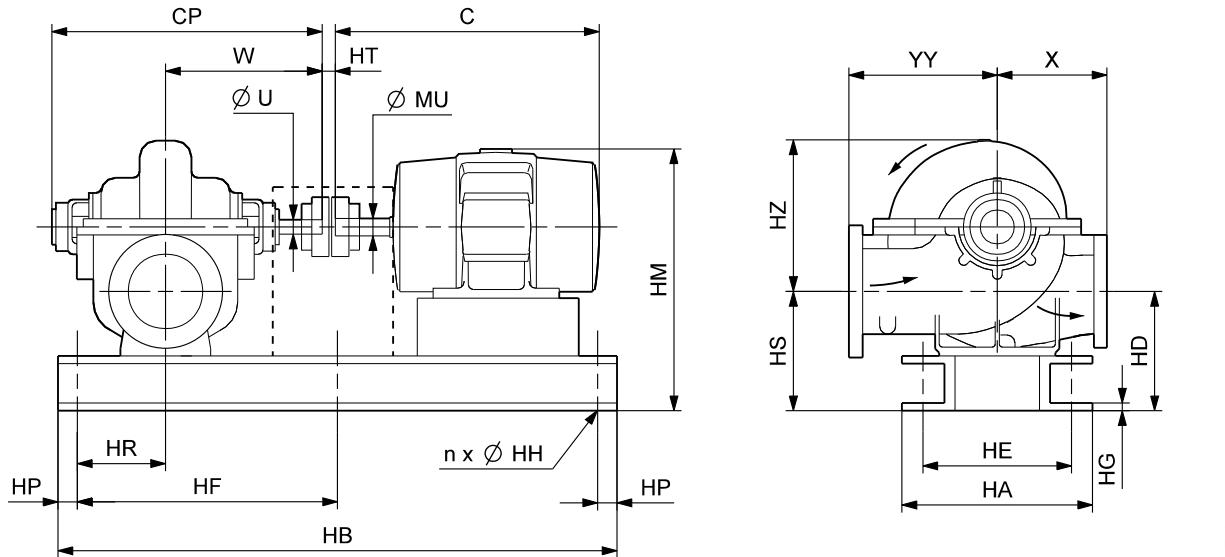

TM057525 1113

The grey line represents a maximum shaft load of 2.7 kW/100 rpm when pumping water. If the required shaft load exceeds 2.7 kW/100 rpm, use a larger pump. Be aware that the curves will change when pumping liquids with a higher density and/or viscosity than water.

4-pole HS standard, 200-150-483

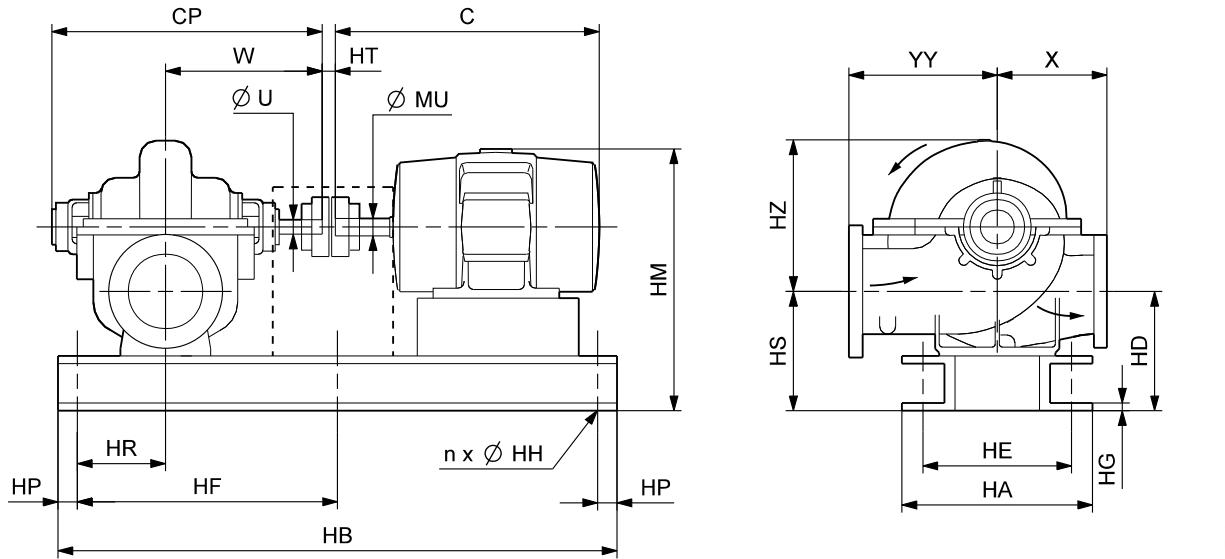

The grey line represents a maximum shaft load of 7.25 kW/100 rpm for a Ø44.5 (1.75 inch) pump shaft when pumping water. If the required shaft load exceeds 7.25 kW/100 rpm, use a pump with a Ø50.8 (2 inch) pump shaft.

Be aware that the curves will change when pumping liquids with a higher density and/or viscosity than water.

This doctitle must be changed on the front

13. Electrical data

The standard motor brand used for the entire HS pump range is Grundfos type MMG-G IE2 motors. Other makes and voltage variants are available on request.

2-pole motors

14. Bare shaft pump

Dimensional sketch

TM04 1827 5110

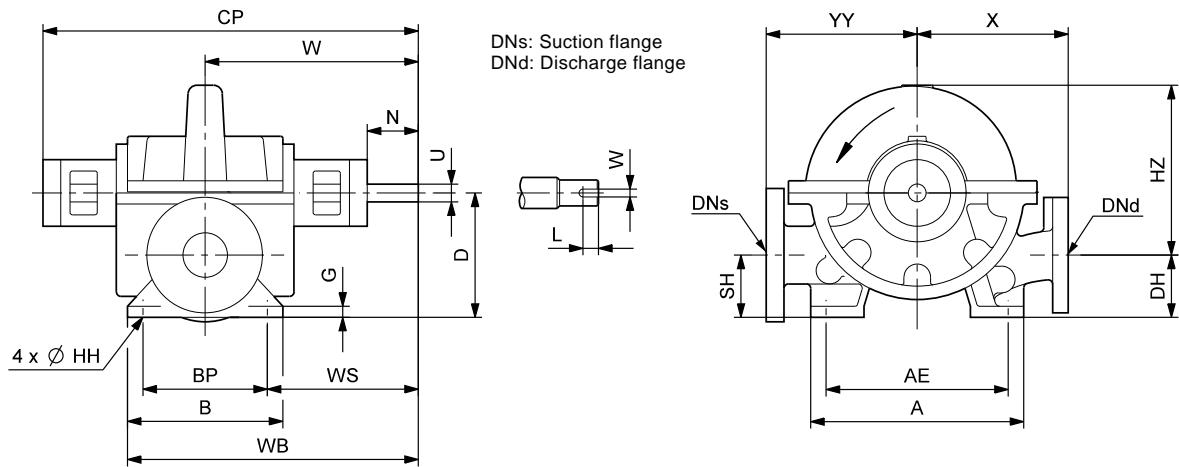

Dimensions

All dimensions are in mm, except for those which have necessary inch tolerances (1 inch = 25.4 mm). For actual pump flange dimensions, see "Standard pump flange dimensions" on page 105. For counter-flange dimensions, "Counter-flange dimensions" on page 107.

²⁾ Shaft load up to 7.25 kW/100 rpm

³⁾ Shaft load above 7.25 kW/100 rpm.

Dimensional sketch

TM04 1827 1108

Dimensions

All dimensions are in mm, except for those which have necessary inch tolerances (1 inch = 25.4 mm). For actual pump flange dimensions, see "Standard pump flange dimensions" on page 105. For counter-flange dimensions, "Counter-flange dimensions" on page 107.

Counter-flange dimensions

Following tables show standard dimensions for counter-flanges.

Counter-flanges to EN 1092-2 (DIN 2501), PN 16

(Ductile iron)

	Nominal flange diameter (DN) [mm]										
	50	65	80	100	125	150	200	250	300	350	400
D1	50	65	80	100	125	150	200	250	300	350	400
D2	125	145	160	180	210	240	295	355	410	470	525
D3	165	185	200	220	250	285	340	400	455	520	580
S	4 x 19	4 x 19	8 x 19	8 x 19	8 x 19	8 x 23	12 x 23	12 x 28	12 x 28	16 x 28	16 x 31
Bolt size	M16	M16	M16	M16	M16	M20	M20	M24	M24	M24	M27

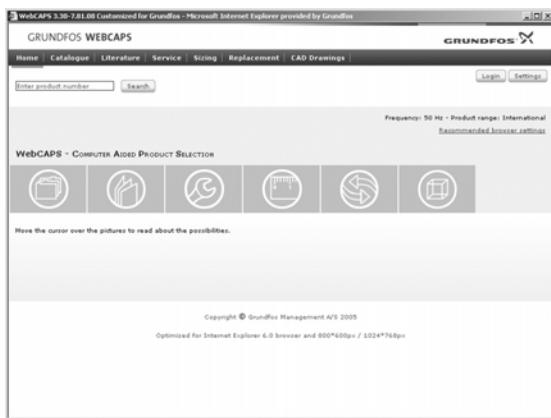

Counter-flanges to EN 1092-2 (DIN 2501), PN 10

(Cast iron)

	Nominal flange diameter (DN) [mm]										
	50	65	80	100	125	150	200	250	300	350	400
D1	50	65	80	100	125	150	200	250	300	350	400
D2	125	145	160	180	210	240	295	350	400	460	515
D3	165	185	200	220	250	285	340	395	445	505	565
S	4 x 19	4 x 19	8 x 19	8 x 19	8 x 19	8 x 23	8 x 23	12 x 23	12 x 23	16 x 23	16 x 28
Bolt size	M16	M16	M16	M16	M16	M20	M20	M20	M20	M20	M24

15. Further product documentation

WebCAPS

WebCAPS is a **Web-based Computer Aided Product Selection** program available on www.grundfos.com.

WebCAPS contains detailed information on more than 220,000 Grundfos products in more than 20 languages.

In WebCAPS, all information is divided into 6 sections:

- Catalogue
- Literature
- Service
- Sizing
- Replacement
- CAD drawings.

This screenshot shows the 'Catalogue' section of WebCAPS. It displays a search results page for 'CR 10' pumps. The search criteria are set to 'Phase: 3', 'Voltage: 380V', and 'Shaft seal: HQQE'. The results list various pump models with their details. On the right, there's a technical graph showing head (Q) versus flow rate (F2). Below the graph, there's a table of pump parameters like rated head, rated flow, and efficiency.

Catalogue

With a starting point in areas of applications and pump types, this section contains

- technical data
- curves (QH, Eta, P1, P2, etc.) which can be adapted to the density and viscosity of the pumped liquid and show the number of pumps in operation
- product photos
- dimensional drawings
- wiring diagrams
- quotation texts, etc.

This screenshot shows the 'Literature' section of WebCAPS. It displays a search results page for 'CR Vertical multistage centrifugal pumps'. The search criteria are set to 'Language: English'. The results list various documents such as 'A white paper - a guide to selecting vertical multistage centrifugal pumps', 'CR 1 to 30 user manual', and 'CR 1 to 30 service manual'. On the right, there's a thumbnail image of a data booklet titled 'GRUNDFOS DATA BOOKLET'.

Literature

In this section you can access all the latest documents of a given pump, such as

- data booklets
- Installation and operating instructions
- service documentation, such as Service kit catalogue and Service kit instructions
- quick guides
- product brochures, etc.

This screenshot shows the 'Service' section of WebCAPS. It displays a search results page for 'CR' pumps. The search criteria are set to 'Phase: 3'. The results list various pump models with their details. On the right, there's a technical diagram of a pump assembly with various parts labeled for replacement.

Service

This section contains an easy-to-use interactive service catalogue. Here you can find and identify service parts of both existing and cancelled Grundfos pumps. Furthermore, this section contains service videos showing you how to replace service parts.

WinCAPS

Fig. 36 WinCAPS CD-ROM

Sizing

With a starting point in different application areas and installation examples, this section gives easy step-by-step instructions in how to

- select the most suitable and efficient pump for your installation
- carry out advanced calculations based on energy consumption, payback periods, load profiles, lifecycle costs, etc.
- analyse your selected pump via the built-in lifecycle cost tool
- determine the flow velocity in wastewater applications, etc.

Replacement

In this section you find a guide to select and compare replacement data of an installed pump in order to replace the pump with a more efficient Grundfos pump. The section contains replacement data of a wide range of pumps produced by other manufacturers than Grundfos.

Based on an easy step-by-step guide, you can compare Grundfos pumps with the one you have installed on your site. After having specified the installed pump, the guide suggests a number of Grundfos pumps which can improve both comfort and efficiency.

CAD drawings

In this section it is possible to download 2-dimensional (2D) and 3-dimensional (3D) CAD drawings of most Grundfos pumps.

The following formats are available in WebCAPS:

2-dimensional drawings

- .dxf, wireframe drawings
- .dwg, wireframe drawings.

3-dimensional drawings

- .dwg, wireframe drawings (without surfaces)
- .stp, solid drawings (with surfaces)
- .eprt, E-drawings.
